 - Smart Manufacturing
 - Improved Client/Server Applications
 - Synchronized Servers
 - Edge-to-Cloud
- PubSub Demos
 - #1 Azure
 - #2 Amazon AWS
 - #3 “Global Production Line”
- Conclusions

Client/Server Model

1. Connect a client to a server
 - Create a Session
 - Security Context
2. Browse AddressSpace
 - To find what is available
3. Read
 - a. Variable Values
 - b. Meta data
4. Write
 - a. Variable Values
 - b. (Meta data)
5. Call Methods
6. Read History
 - a. Variables
 - b. Events
7. Disconnect when done
 - Close the Session

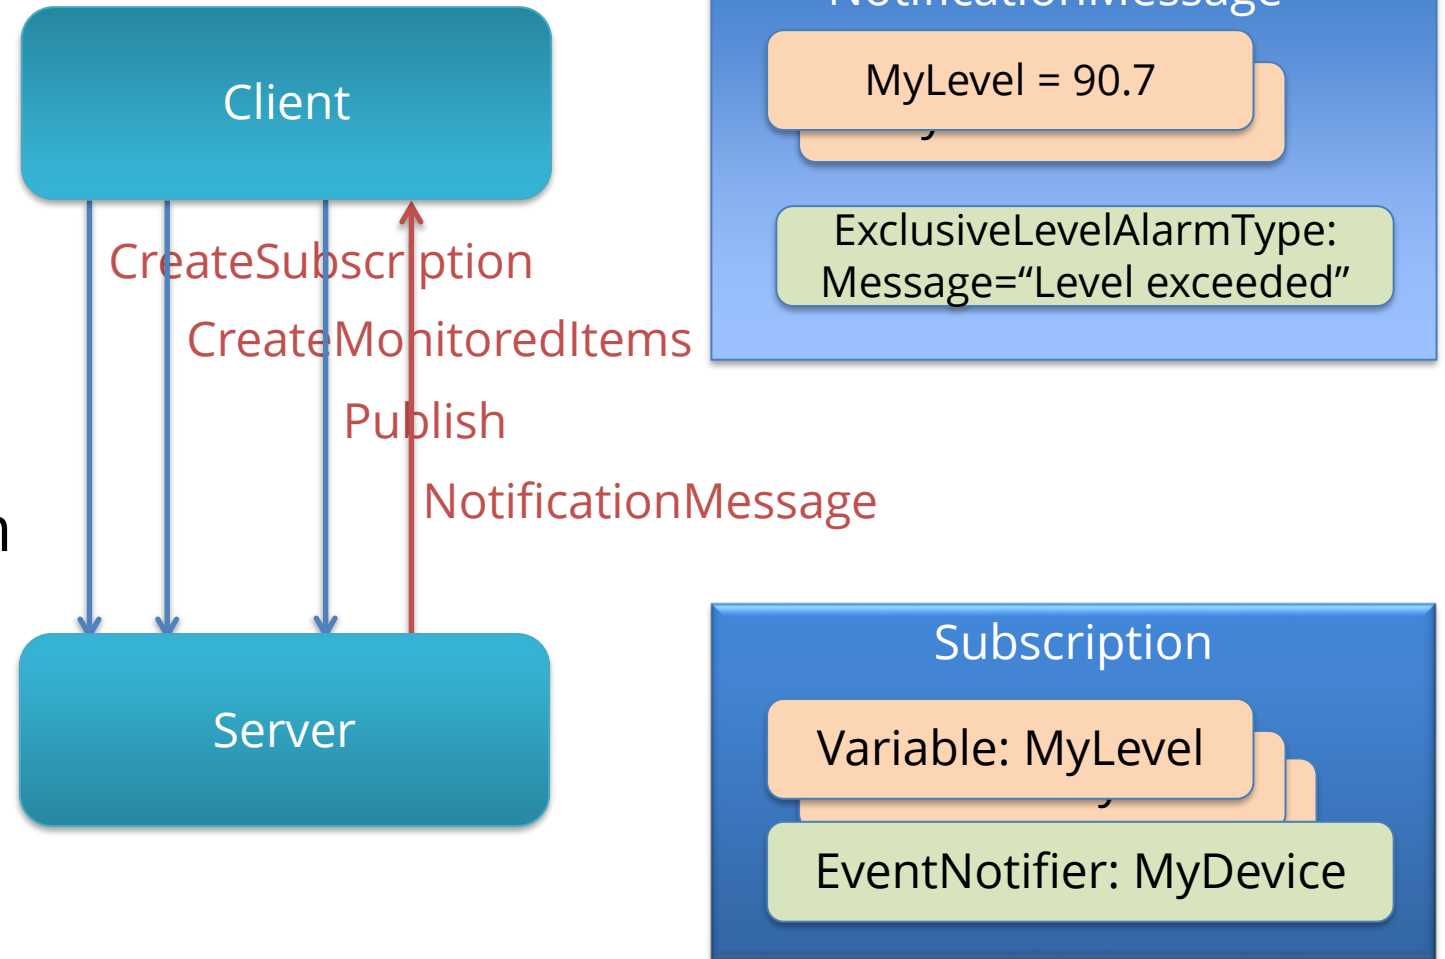

The screenshot shows the OPC UA Browser interface. The top bar indicates the connection is 'Running' and the address is 'opc.tcp://prosys02:53530/OPCUA/SimulationServer'. The 'Objects' tree on the left shows the hierarchy: Objects > Aliases > MyObjects > MyDevice > MyLevel. The 'Attributes and References' panel on the right shows the 'EventNotifier' attribute with the value '[HistoryRead]'. Below the tree, a table displays the history data:

Severity	SourceNode	Message	Time	EventType
700	MyLevel	() Level exceeded	11/03/21 15:20:27.5260000 GMT	ExclusiveLevelAlarmType
500	MyLevel	() Level exceeded	11/03/21 15:20:46.5250000 GMT	ExclusiveLevelAlarmType
500	MyLevel	() Level exceeded	11/03/21 15:21:06.5380000 GMT	ExclusiveLevelAlarmType
500	MyLevel	() Level exceeded	11/03/21 15:21:47.5250000 GMT	ExclusiveLevelAlarmType
700	MyLevel	() Level exceeded	11/03/21 15:22:07.5250000 GMT	ExclusiveLevelAlarmType
500	MyLevel	() Level exceeded	11/03/21 15:22:26.5250000 GMT	ExclusiveLevelAlarmType
500	MyLevel	() Level exceeded	11/03/21 15:22:46.5260000 GMT	ExclusiveLevelAlarmType

The status bar at the bottom indicates 'Status: Success'.

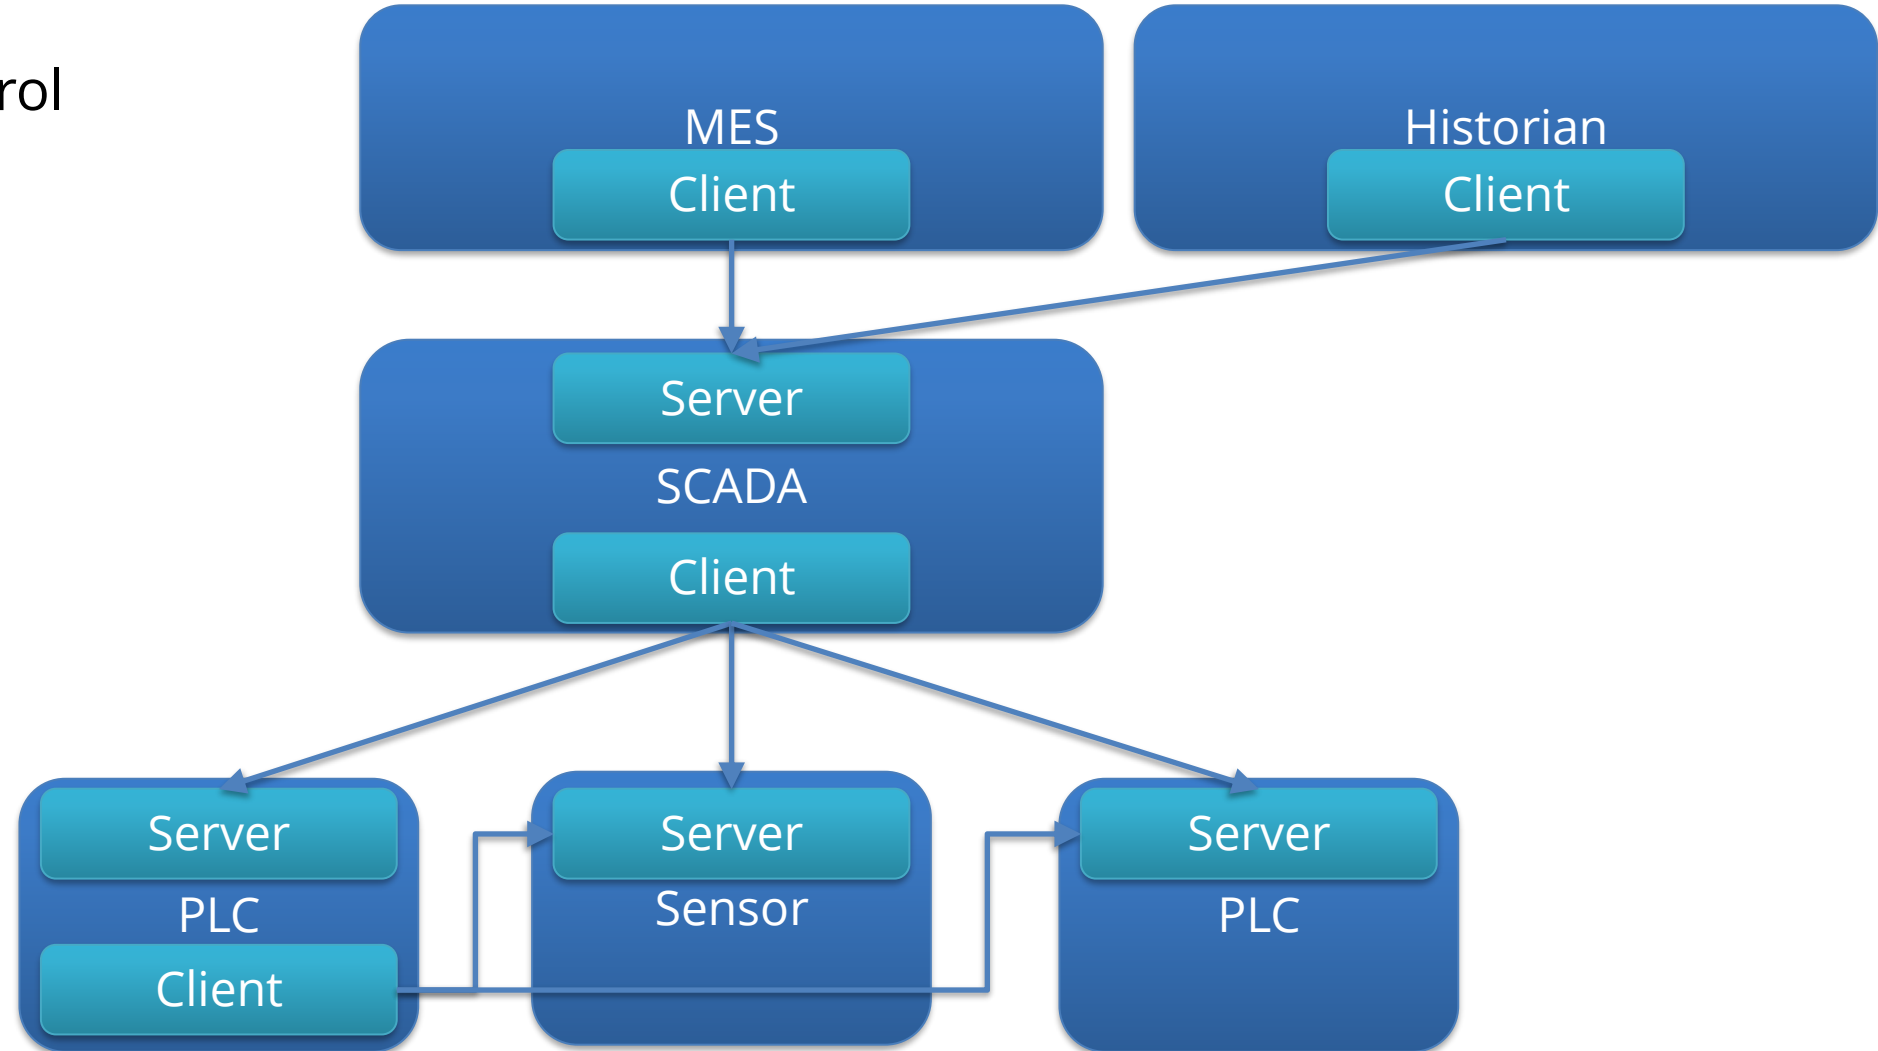

Client/Server Subscriptions

1. Create a **Subscription**
2. Create **MonitoredItems**
 - a. Variables
 - b. EventNotifiers
3. Call **Publish** to receive
4. **NotificationMessages** with
 - a. Data Changes
 - b. Events

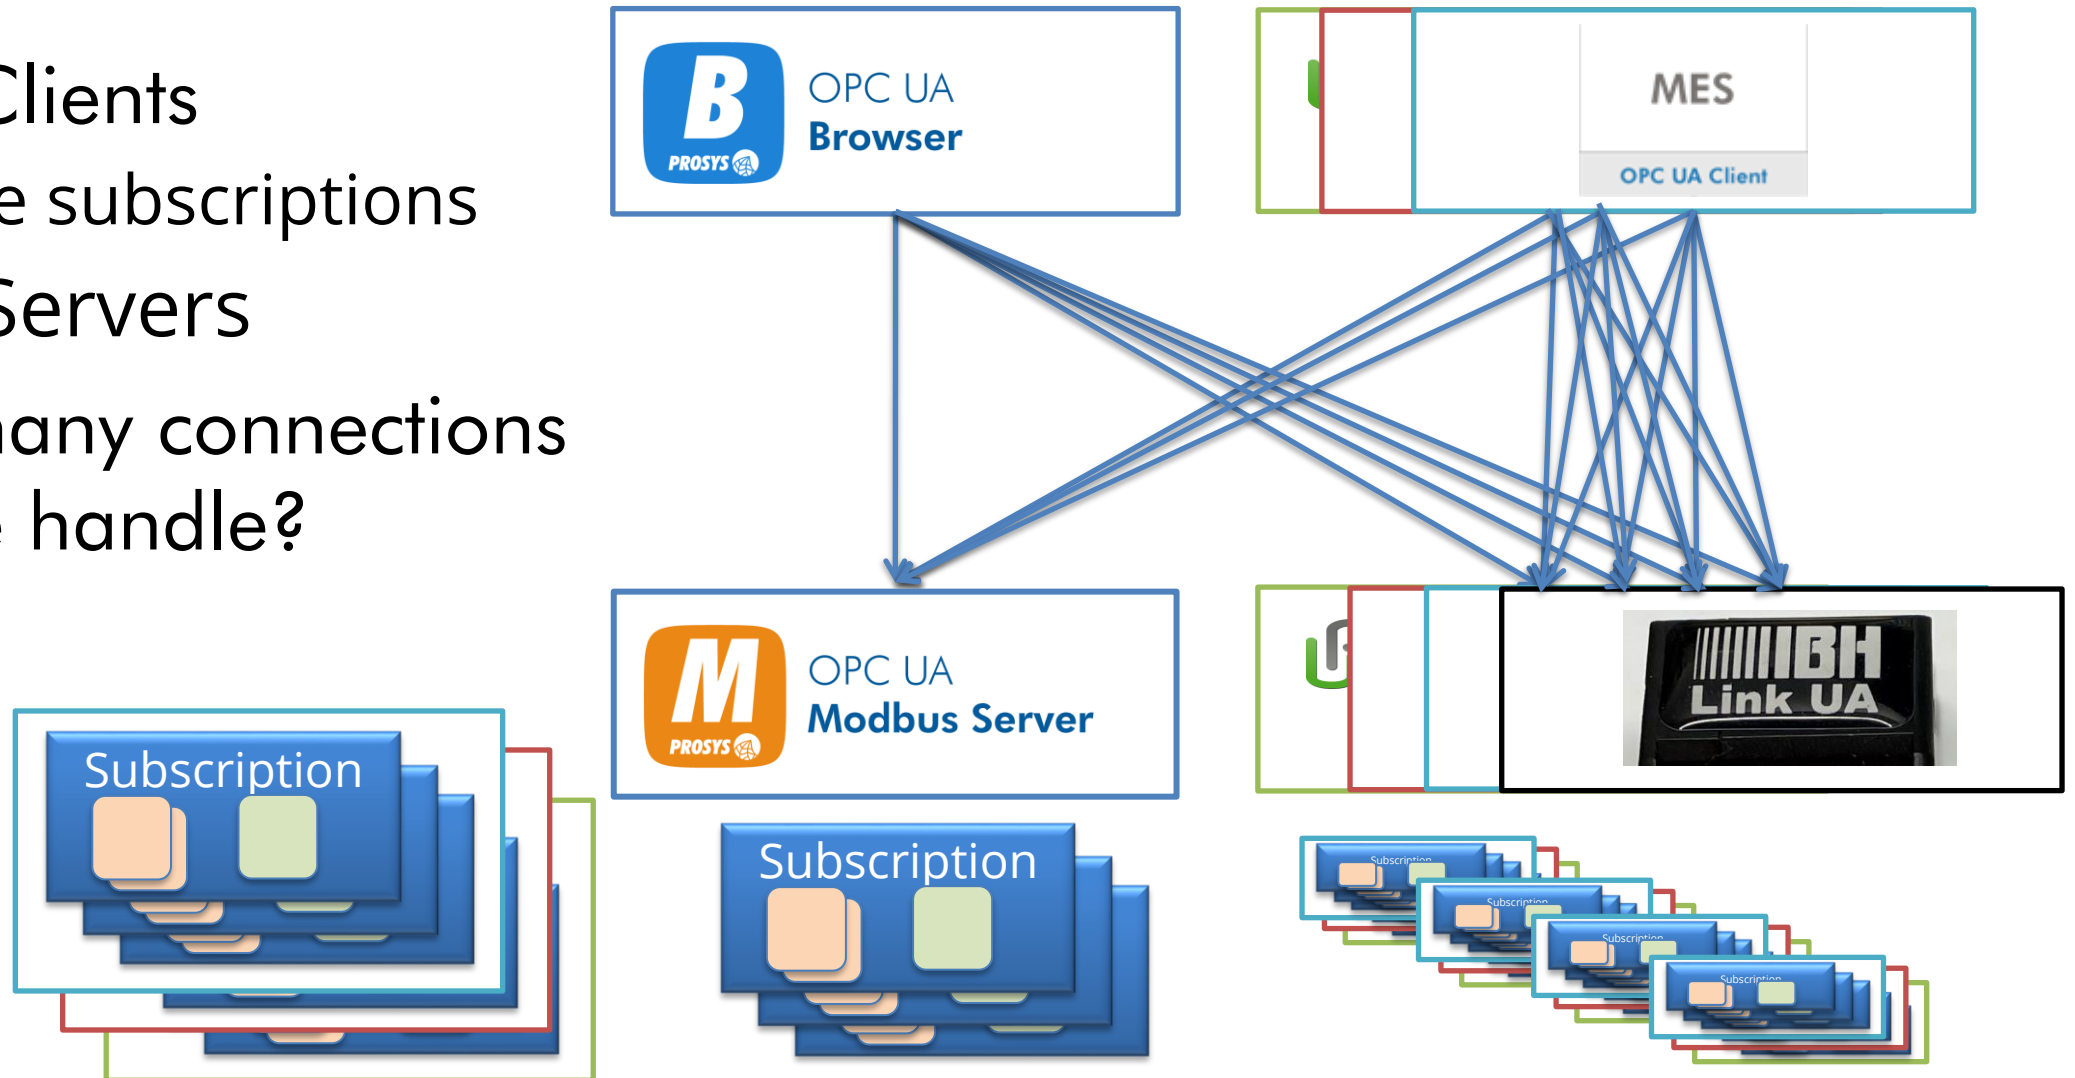

Client/Server Main Scenario

- Supervisory Control
- Data Acquisition
- + MES
- + Historian
- + Even PLC-to-PLC!

Client/Server Scaling

- More Clients
 - More subscriptions
- More Servers
- How many connections can we handle?

Client/Server Pros & Cons

- Session-based
 - + Security context
 - Requires a steady connection -> Suffers from network interruptions
 - Requires resources per connection -> Does not scale
- Client-specific Subscriptions
 - + Fully customized per client
 - Requires resources per connection -> Does not scale
- Synchronous services
 - + Read, HistoryRead
 - + Write, Method Call
- Information Models
 - + Data and Metadata (Types) Discovery via Address Space
- Security
 - + Flexible for fine-grained ruling per application and user

 - #1 Azure
 - #2 Amazon AWS
 - #3 “Global Production Line”
- Conclusions

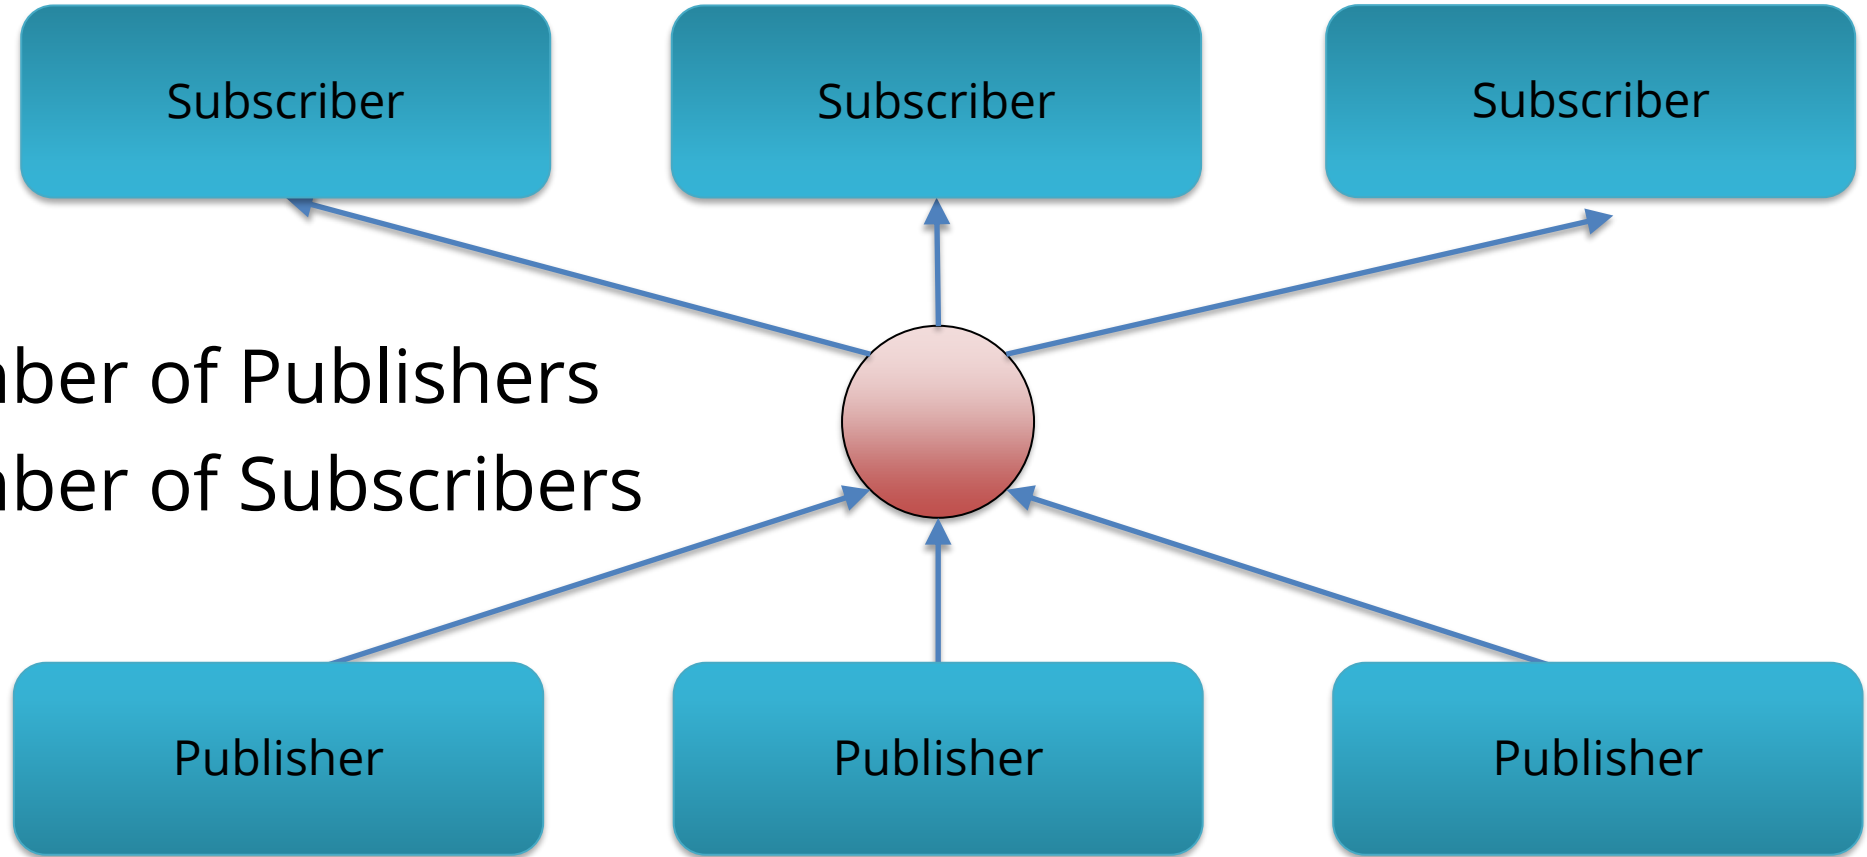

Publisher/Subscriber Model

1. Create **DataSets** with
 - a. Variables
 - b. EventNotifiers
2. **Publish** **DataSetMessages** to Network with
 - a. Data Changes
 - b. Events
3. **Subscriber** can filter what it needs

Publisher/Subscriber Scaling

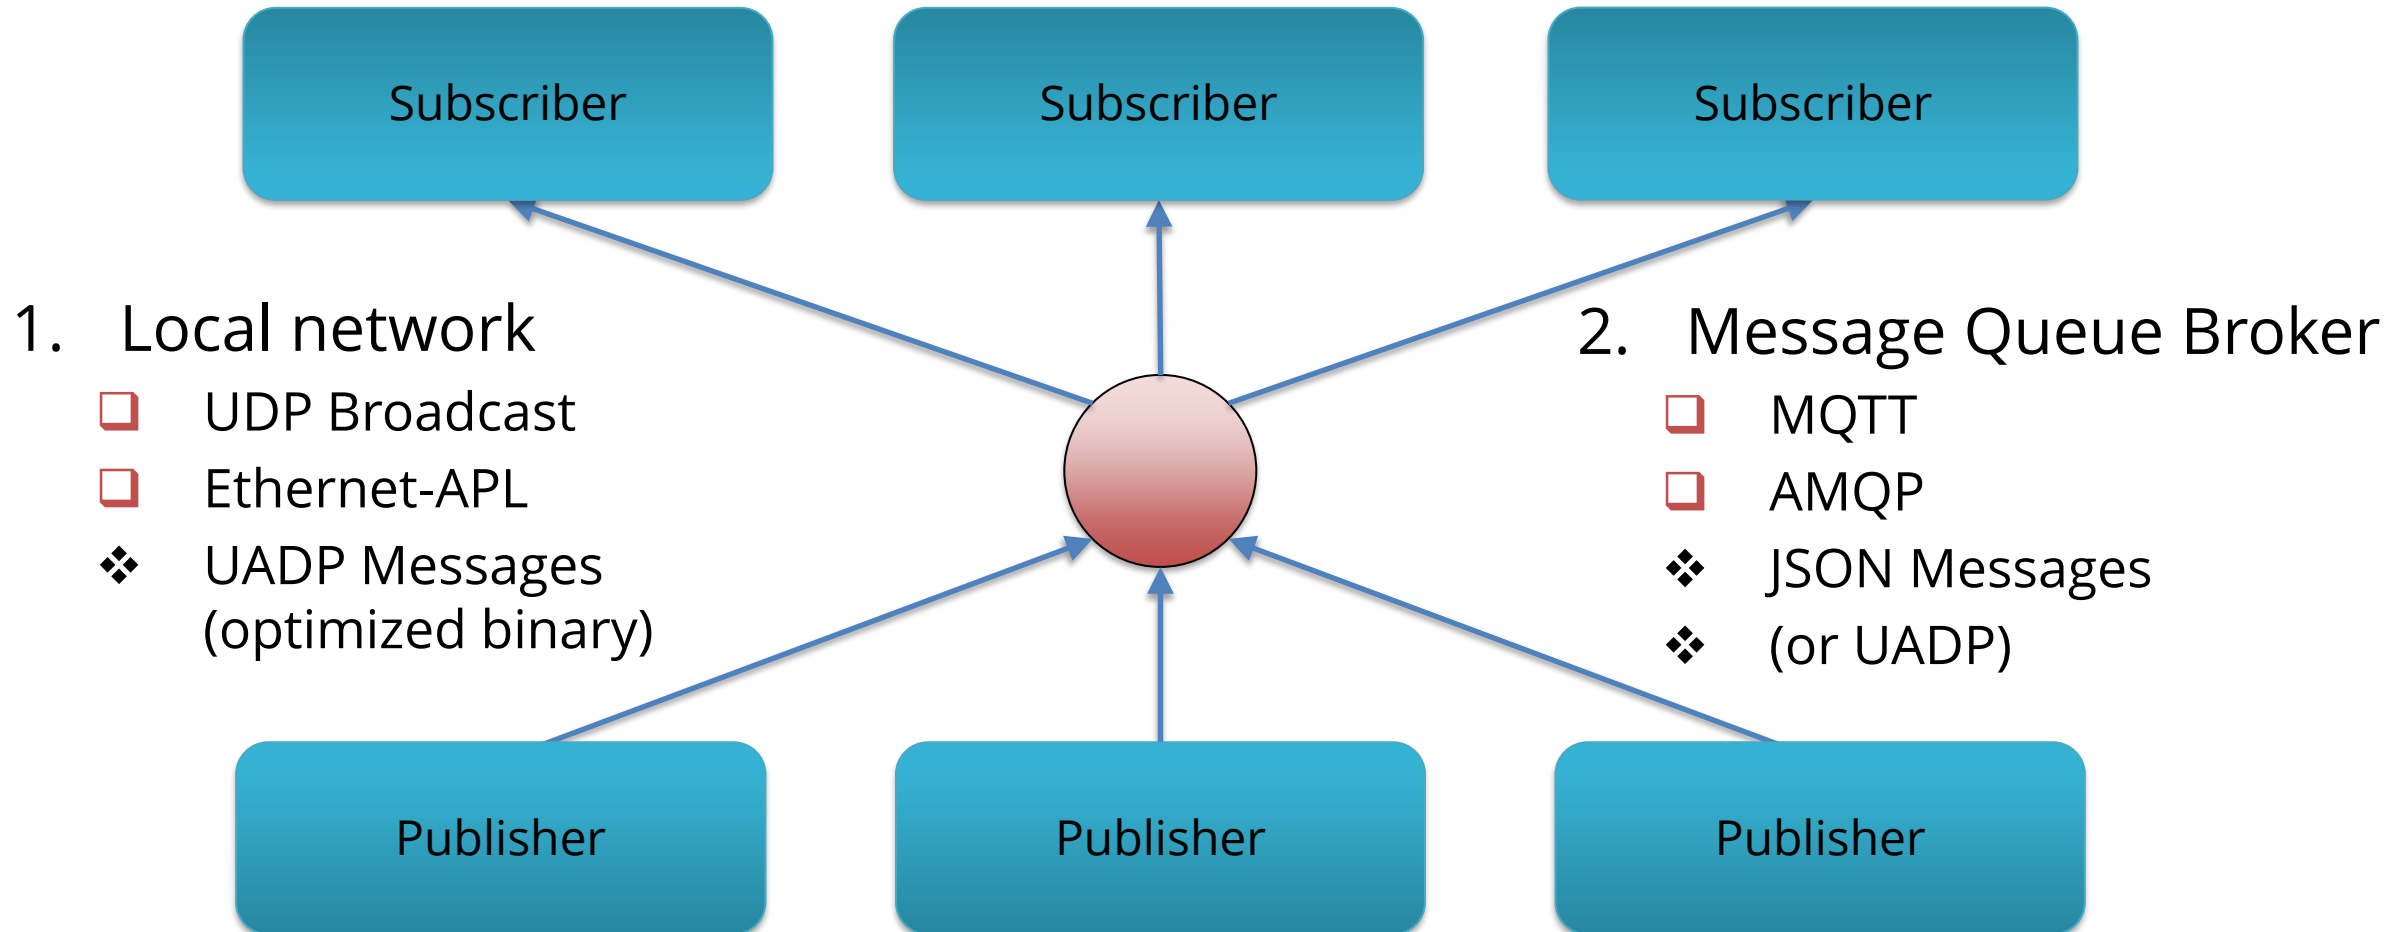

1. Any number of Publishers
2. Any number of Subscribers

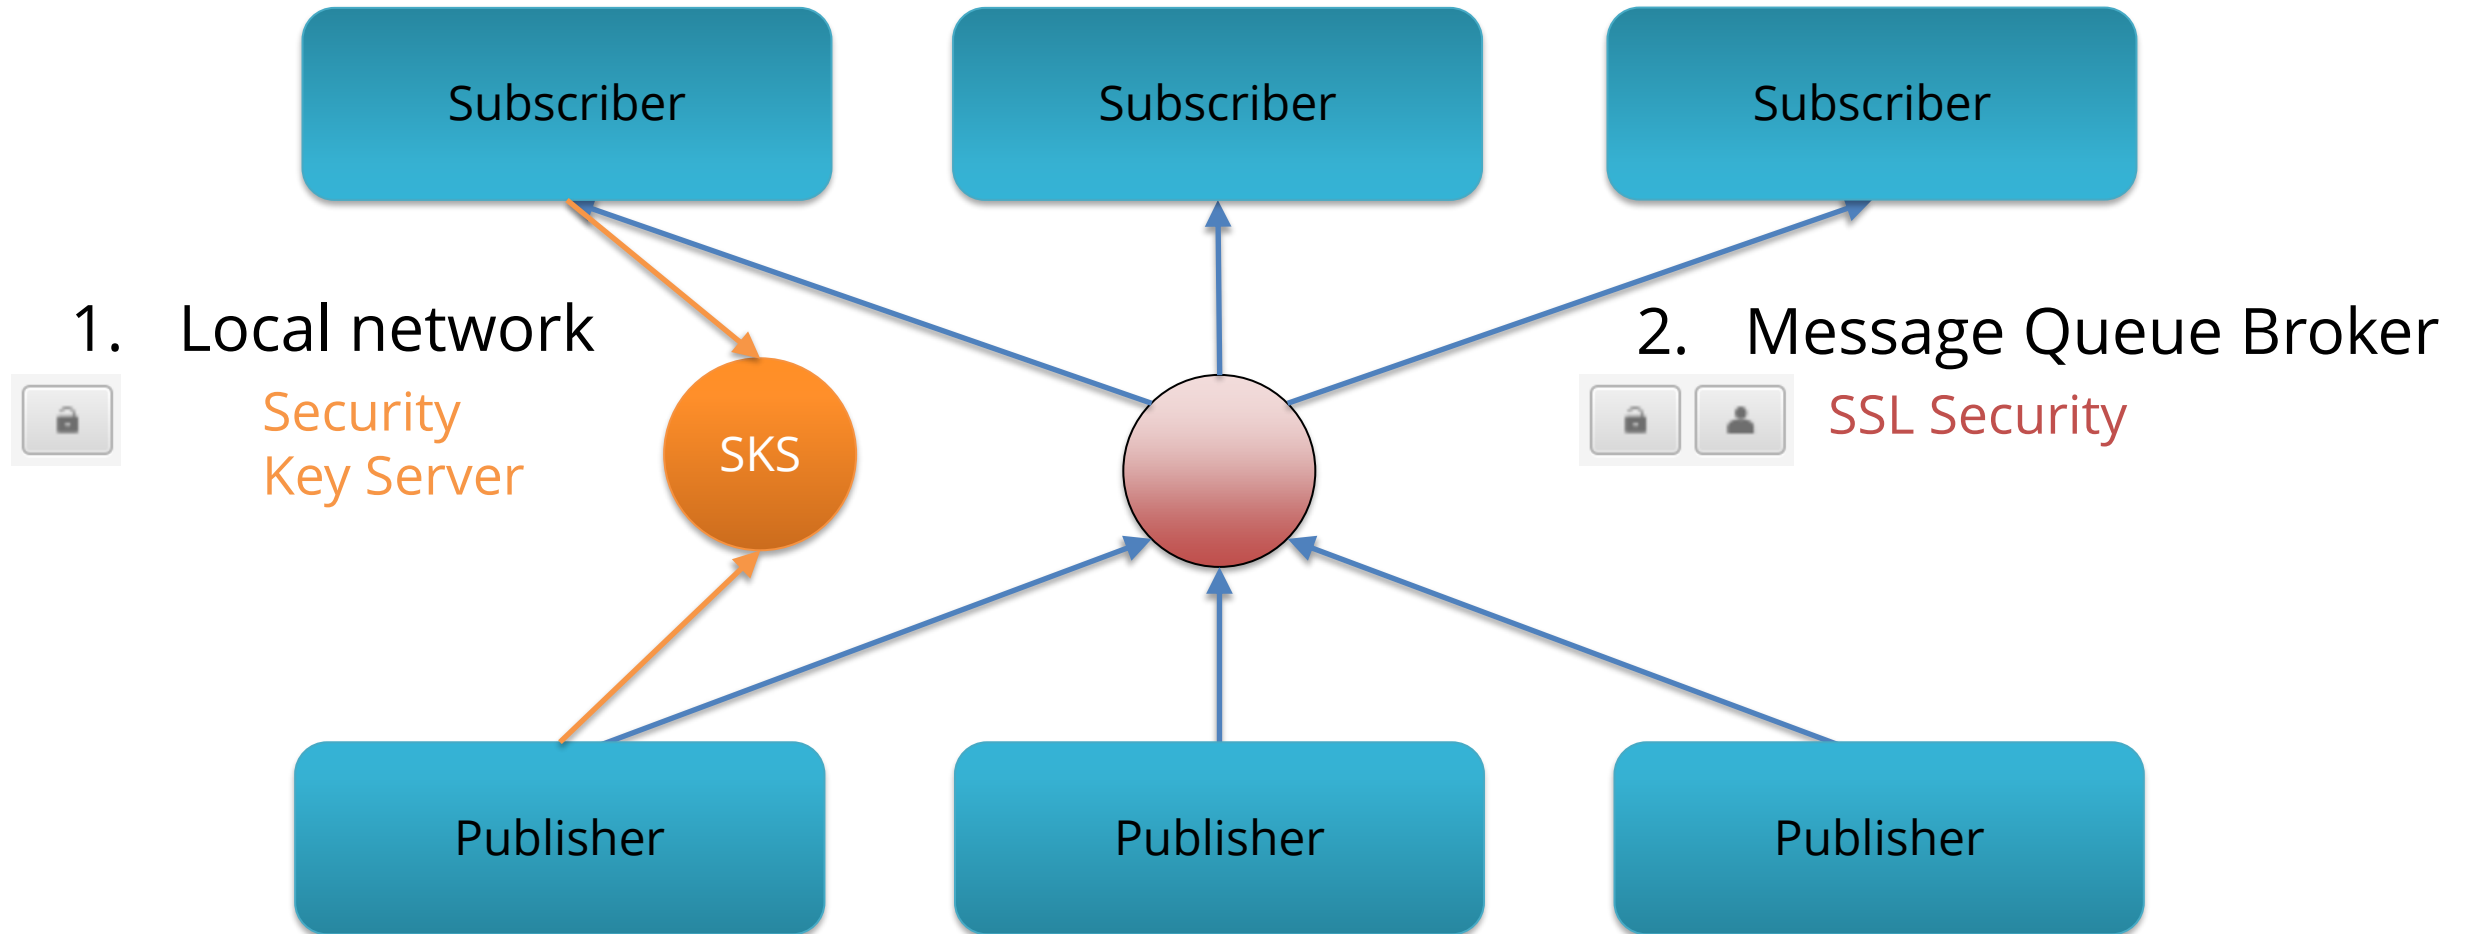

➤ Highly Scalable

Verified: 2 Publishers, 31 Subscribers,
40000 variables = 3.5 MB/s (by both publishers)

Publisher/Subscriber Networks

Publisher/Subscriber Security

Publisher/Subscriber Pros & Cons

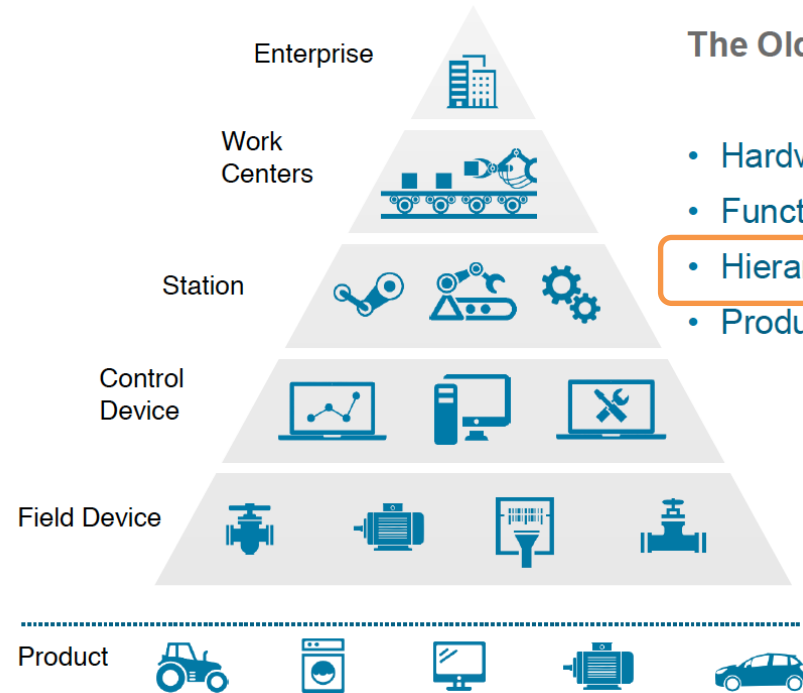

- No Sessions
 - + No connection management
 - + Flexible at unreliable networks
 - Requires an external shared Security Key Server with UDP/Ethernet APL
- Multicast
 - + Deliver big amounts of data to many receivers
- Fixed Datasets
 - + Fixed resource management -> Scales to large networks
 - Static configuration
- No Synchronous services
 - No Write
 - No Method calls
 - No HistoryRead
- Configuration
 - Especially in large networks

- Conclusions

PubSub Scenario: Smart Manufacturing

The Old World: Industrie 3.0

- Hardware-based structure
- Functions are bound to hardware
- Hierarchy-based communication
- Product is isolated

The New World: Industrie 4.0

- Flexible systems and machines
- Functions are distributed throughout the network
- Participants interact across hierarchy levels
- Communication among all participants
- Product is part of the network

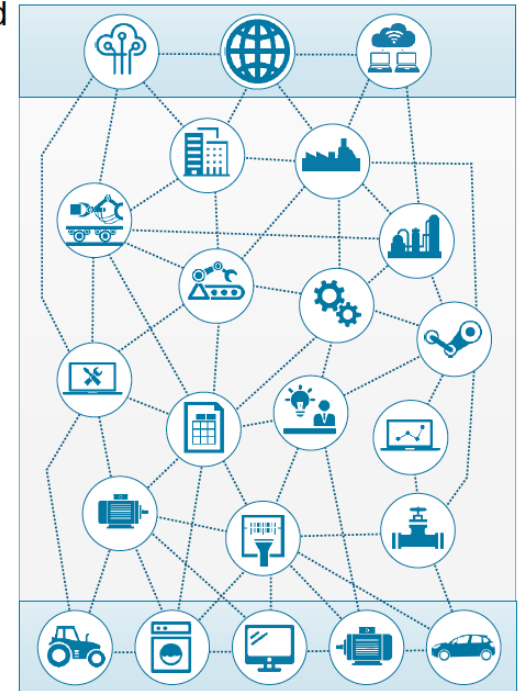

Client / Server

Publisher/Subscriber

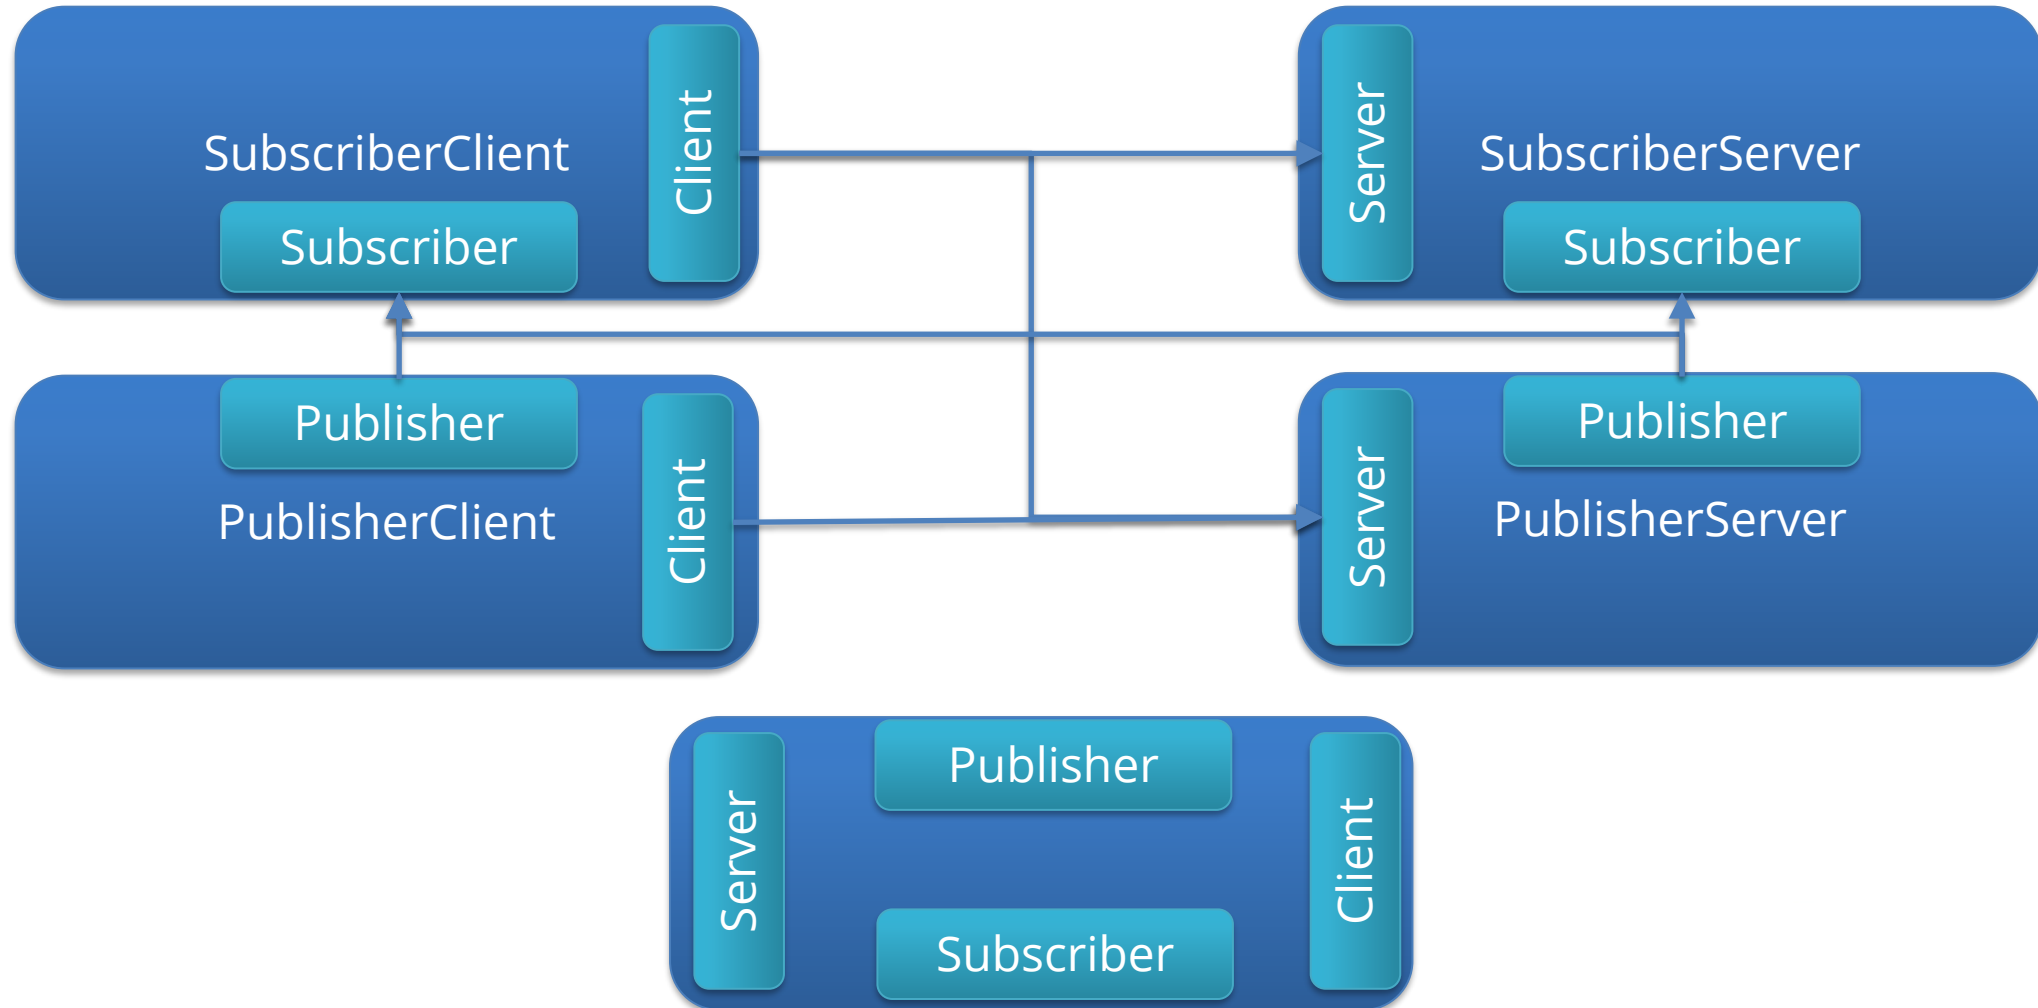

Connected World

Smart Factory

Smart Products

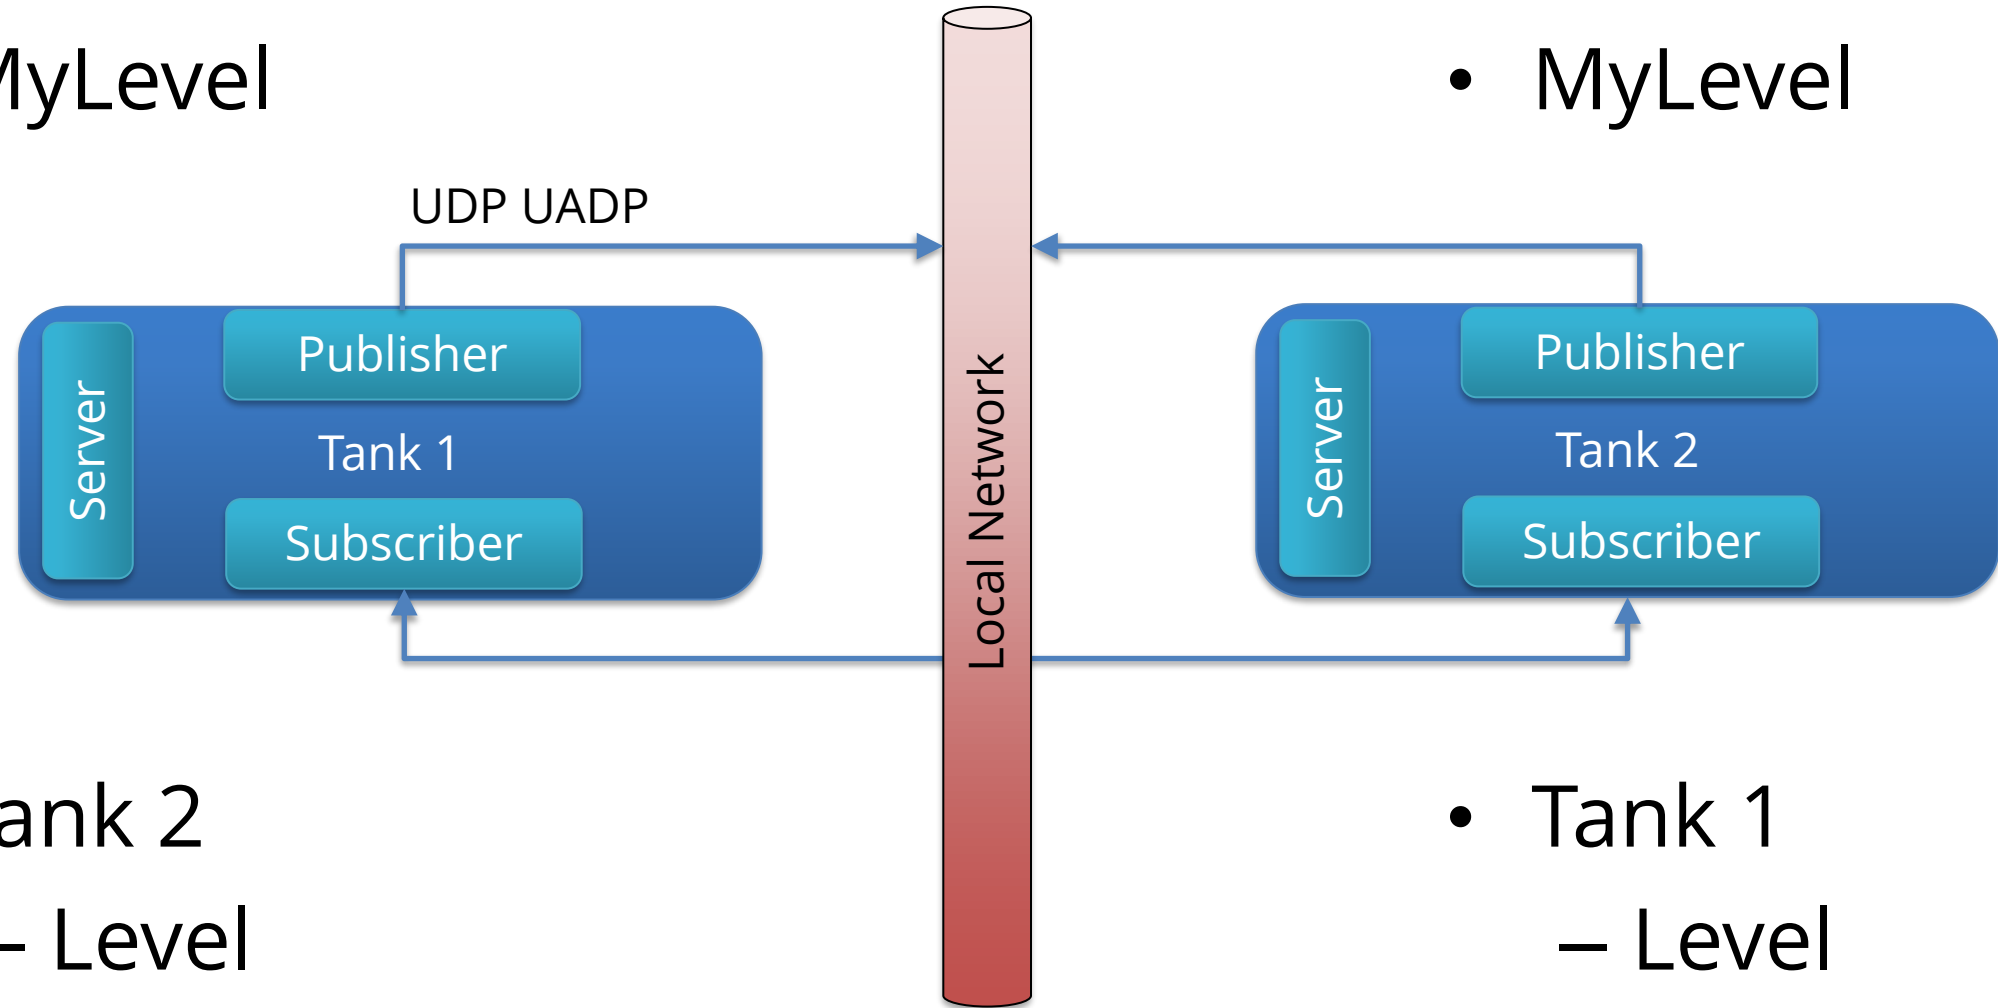

PubSub Scenario: Improved Client/Server Applications

PubSub Scenario: Synchronized Servers

- MyLevel

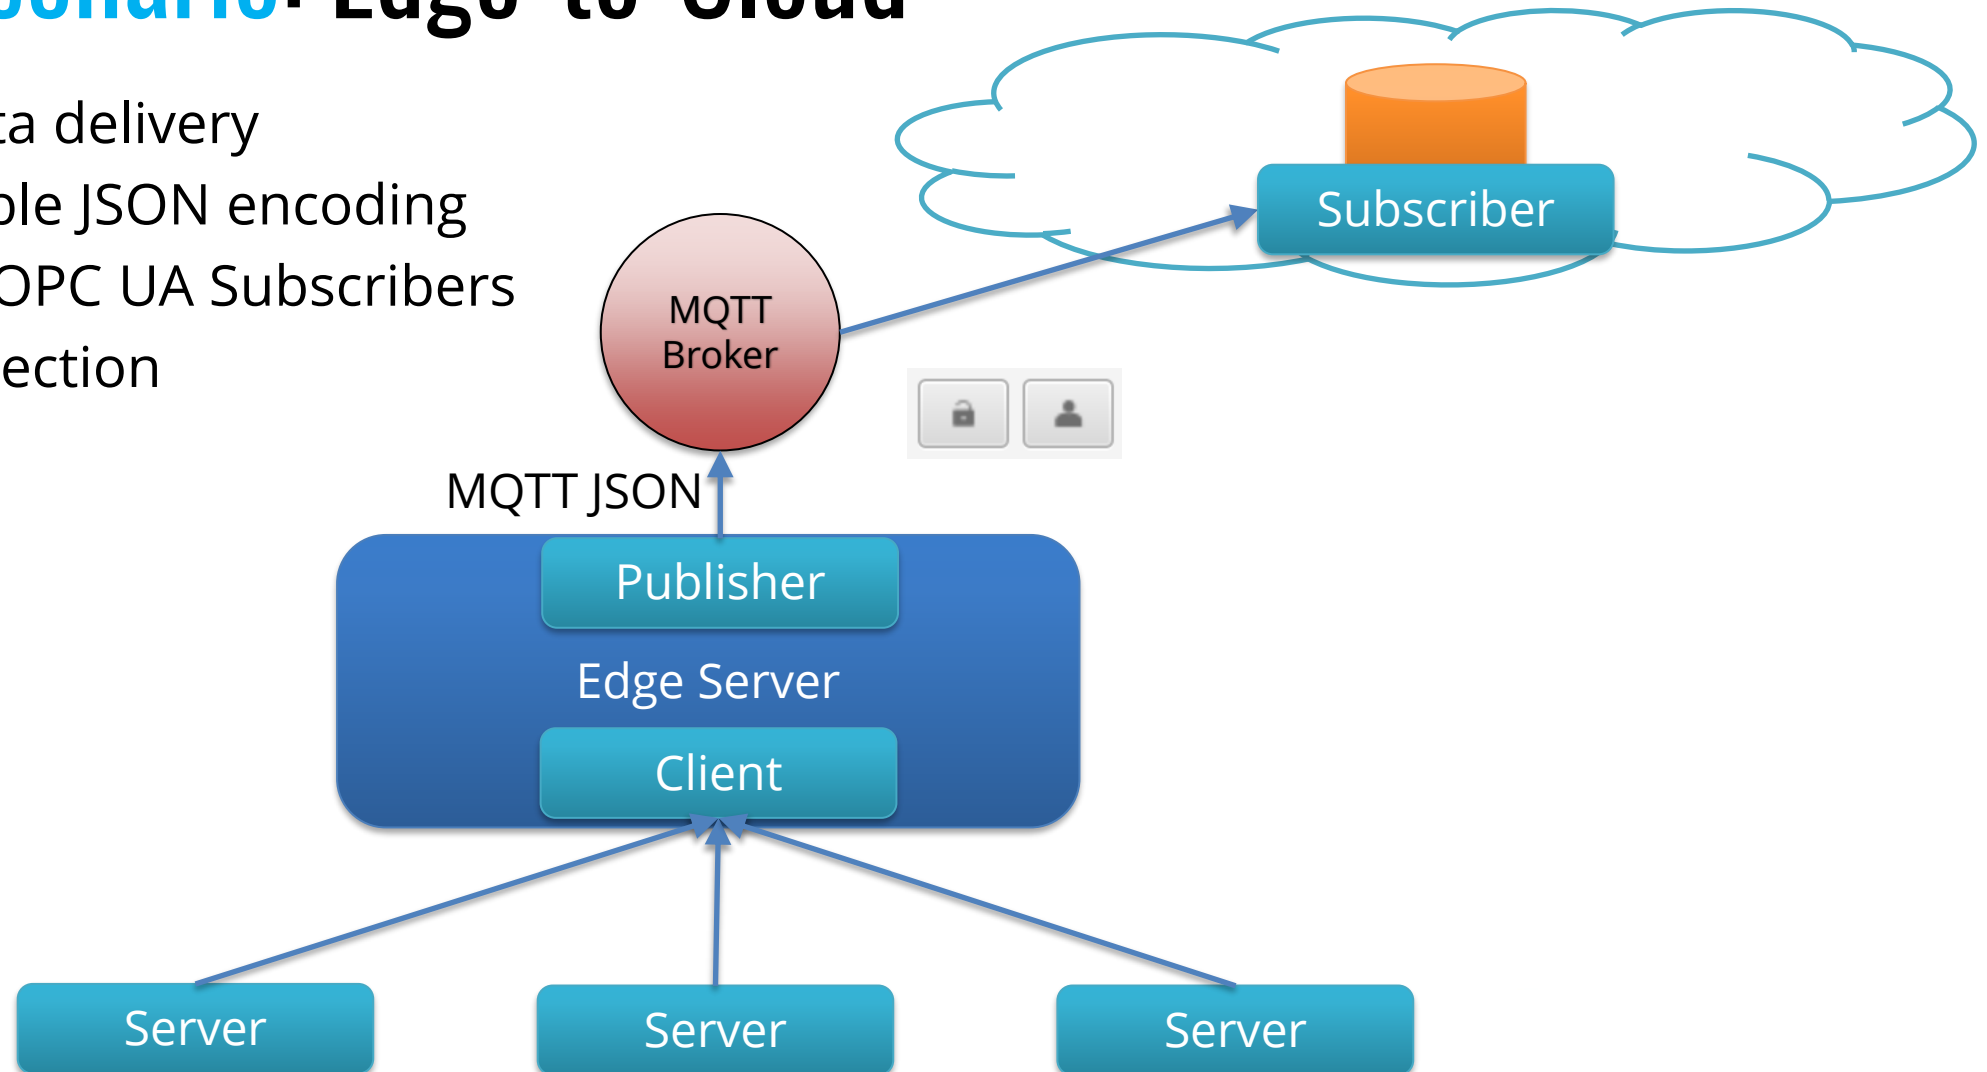

- MyLevel

- Tank 2
– Level

- Tank 1
– Level

PubSub Scenario: Edge-to-Cloud

- One way data delivery
- Non-reversible JSON encoding
 - for non-OPC UA Subscribers
- Secure connection
 - SSL

PubSub Demo #1: Azure MQTT

DataSetMessage

```
{
  "MyLevel": {
    "Value": 73.0,
    "SourceTimestamp": "2021-07-07T17:36:29+0300"
  },
  "MyLevelDisplayName": {
    "Value": "MyLevel"
  }
}
```

```
>samplepublisherserver.bat
--address ssl://<IoT Hub hostname>:8883
--encoding json
--username <IoT Hub hostname>/<device id>/?api-version=2018-06-30
--password <device SAS token>
--client-id <device id>
--queue-name devices/<device id>/messages/events/
--metadata-queue-name devices/<device id>/messages/events/
--non-reversible-json
```

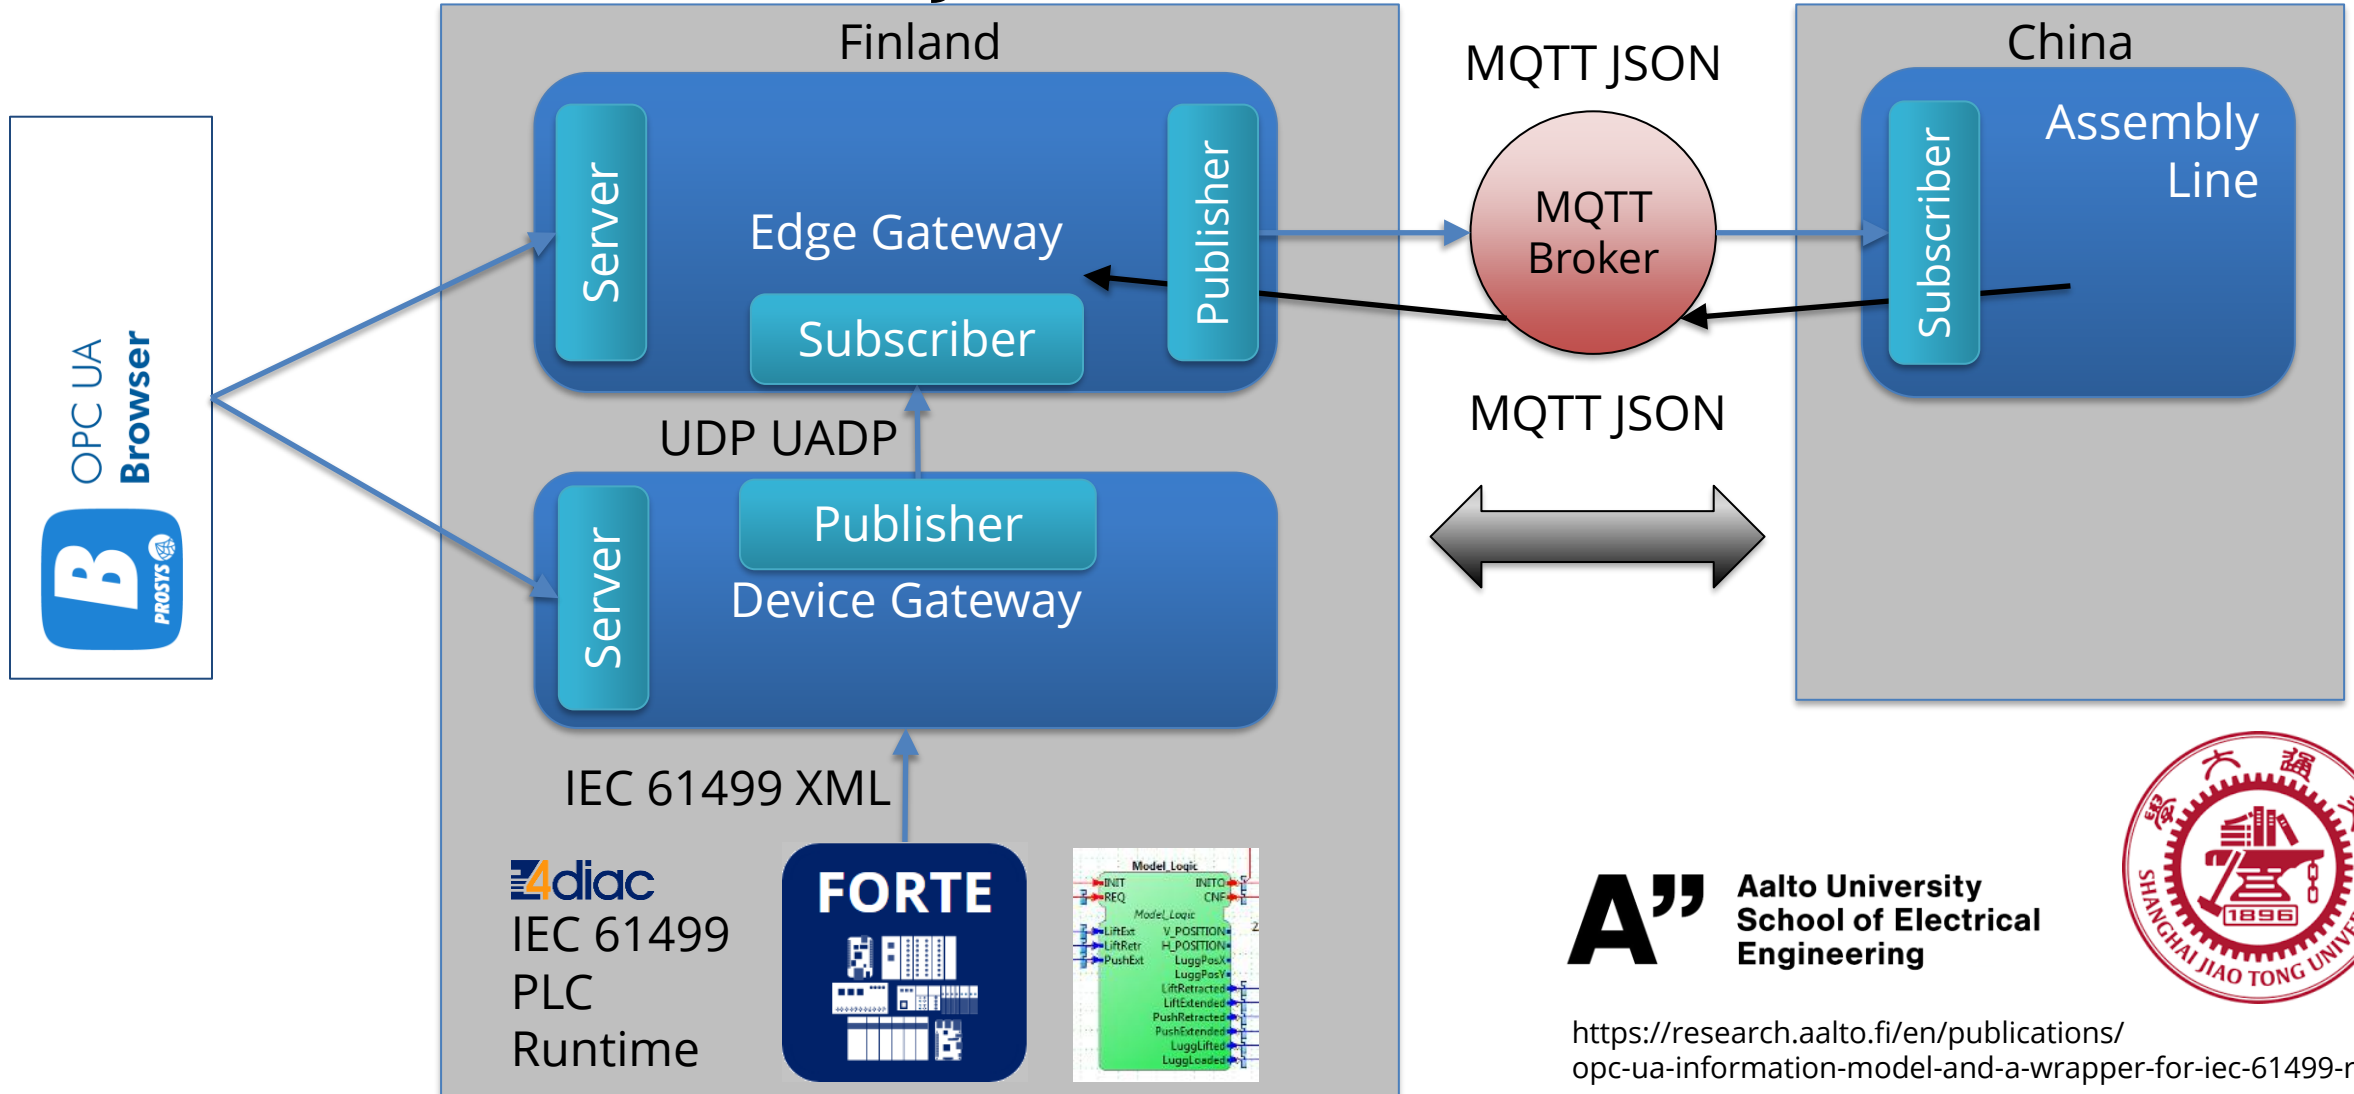

PubSub Demo #2: Amazon AWS MQTT

- MQTT Client Authentication with SSL Certificates (verified)
- Parallel MQTT connections for extended throughput (to be verified)

(Blog article coming up soon)

PubSub Demo #3: Globally Distributed Production

PubSub Demo #3: Information Models

Conclusions

- OPC UA Client/Server is still useful and required for
 - Synchronous operations (Read, Write, Method call, etc.)
 - Information models
- OPC UA Publisher/Subscriber model will enable new application scenarios
 - Improved scalability towards smart manufacturing networks
 - Improved performance in local networks -> Field Exchange
 - Connectionless data delivery: Edge-to-Cloud
- Tricky issues with PubSub
 - Configuration
 - Security (UDP/Ethernet APL)
 - Centralized Management Tools Required
